Global Change Paleobiology. The future for paleontology

Data: Martedì, 12 Febbraio, 2013 - 16:30

Aula: Aula Arduino

Relatore: Prof. Wolfgang Kiessling

Abstract:

Paleontologists have long claimed to use the history of life to predict the future, but rarely do so in an explicit way. To secure long-term survival of the discipline, we need to develop a research program that contributes directly to current problems associated with global change. Global Change Paleobiology is the science of linking large-scale patterns in the fossil record with global environmental change and has the aim to inform ecologists and conservation biologists on expected ecological and evolutionary impacts of global warming and habitat loss.
